OPTIMA Compact EP

DN50-DN200

Application

OPTIMA Compact EP (Extended Performance) pressure independent balancing & control valves (PICVs) are used in applications with high demands for temperature and differential pressure, such as district heating and low-temperature cooling applications. The OPTIMA Compact EP provides modulating control with full authority, regardless of any fluctuations in the system's differential pressure.

The OPTIMA Compact EP combines an externally adjustable balancing valve, a differential pressure control valve, and a full-authority modulating control valve. This integration makes it simple to achieve 100% control of the flow in the building, enhancing comfort and achieving energy savings simultaneously.

An additional benefit is that no balancing is required when further stages are added to the system or when the dimensioned capacity changes. Energy savings are achieved through optimal control, lower flow, and reduced pump pressure. The maximised ΔT, due to faster response and increased system stability, further contributes to overall efficiency.

Benefits

Design

- Less time to define the necessary equipment for a hydraulic balanced system (only flow data are required)
- No need to calculate valve authority - always one
- Flexibility if the system is modified after the initial installation

Installation

- No further regulating valves required in the distribution pipework when OPTIMA Compact EP is installed at the units
- Total number of valves minimized due to the 3-in-1 design
- Minimized commissioning time due to automatic balancing of the system
- No minimum straight pipe lengths required before or after the valve

Operation

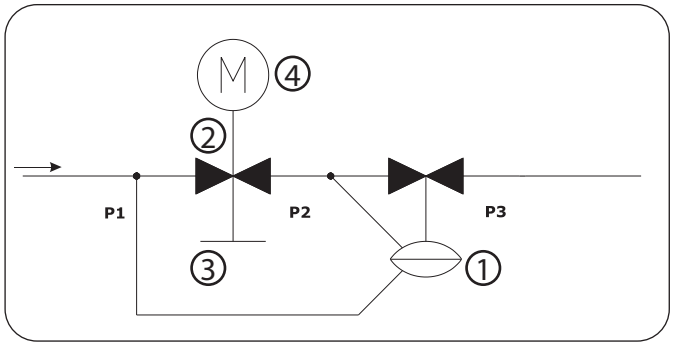
- High comfort for the end-users due to high precision temperature control
- Longer life due to less movements of the actuator

Features

- The valve is specifically engineered to operate efficiently across a wide temperature range, from -10°C to +150°C, ensuring reliable performance in both low and high-temperature environments
- Differential pressure operating range up to 1200 kPa
- The presetting function has no impact on the stroke; Full stroke modulation at all times, regardless the preset flow
- Regulation characteristic remains unchanged regardless of preset flow
- The constant differential pressure across the modulating control component guarantees 100% authority
- Automatic balancing eliminates overflows, regardless of fluctuating pressure conditions in the system
- Motoric actuator 0-10 V, 4-20 mA and 3 point control
- High flows with minimal required differential pressure due to advanced design of the valve
- Small dimensions due to compact housing
- Higher presetting precision due to stepless analogue scale
- Rangeabililty > 100:1

OPTIMA Compact EP

DN50-DN200



Design

The design of OPTIMA Compact EP combines high performance and a compact design.

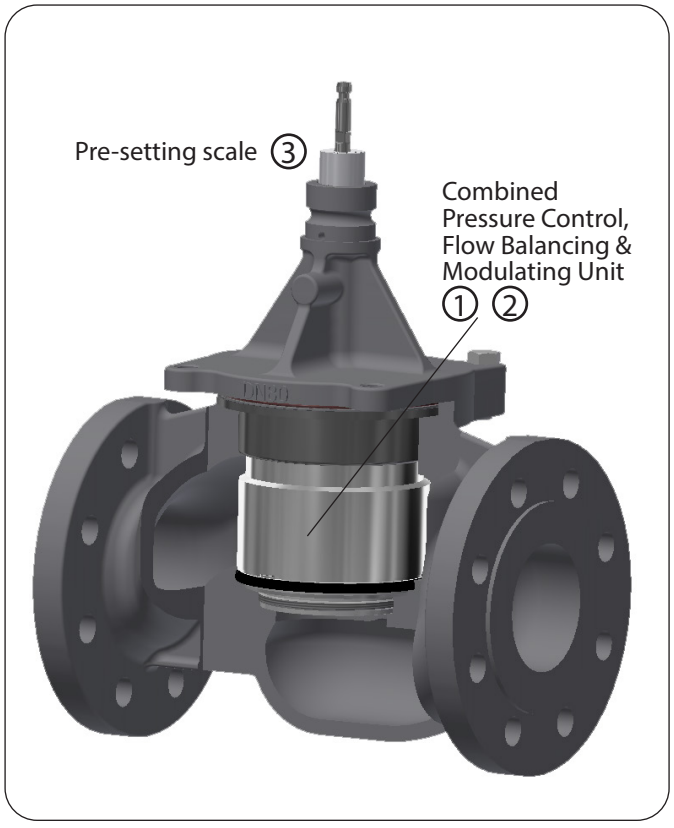
The main components of the valve are:

① Differential pressure control

② Modulating control component

③ Presetting scale

④ Actuator



Function

The OPTIMA Compact EP can be flushed and commissioned before the actuator is installed.

The presetting of the dial is user-friendly requiring only a simple flow vs. presetting graph.

Once the flow is set, the actuator can be mounted and the valve ready to operate.

For lowest energy consumption, check the differential pressure at the index valve to set the pump at minimum speed.

Operating Pressure

OPTIMA Compact EP DN50-DN200 can operate to a maximum differential pressure of 1200 kPa (12 bar)

Close Off Pressure

The OPTIMA Compact EP is capable of closing against the following differential pressure to EN 1349 Class IV:

DN50 to DN125: 1200 kPa - based on 800N actuator force
DN150 to DN200: 1200 kPa - based on 1100N actuator force

OPTIMA Compact EP

DN50-DN200

Operation principle

The innovative design of OPTIMA Compact EP features a modulating control component that retains 100% authority at all times.

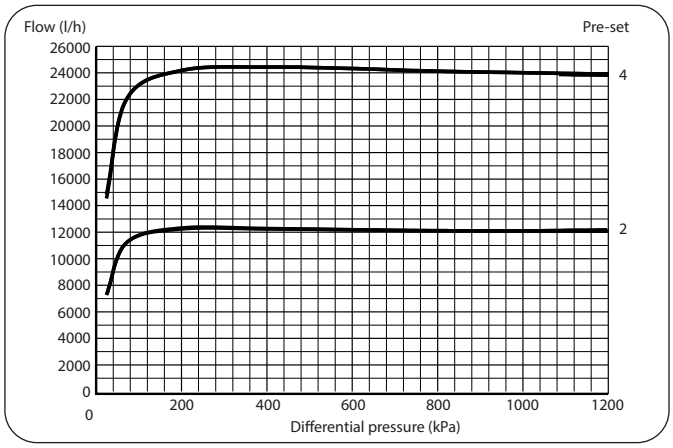
With the OPTIMA Compact EP, there are two independent movements for the presetting and the modulating function.

During presetting, the inlet area moves radially without interfering with the length of the stroke. During modulating, the inlet area moves axial taking advantage of the full stroke. Whilst the control component provides proportional modulation irrespective of the preset flow, the automatic balancing guarantees that the flow will never exceed the maximum preset flow.

Regardless of pressure fluctuations in the system, the maximum flow is kept constant up to a maximum differential pressure of 1200 kPa.

Flow rate vs. Differential Pressure

Preset flow: 24000 l/h, 12000 l/h



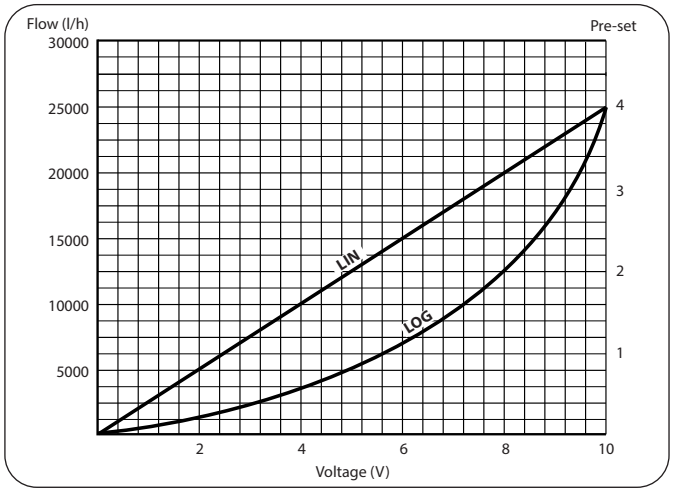
Flow rate vs. Voltage

Preset flow: 25000 l/h

Valve Characteristic:

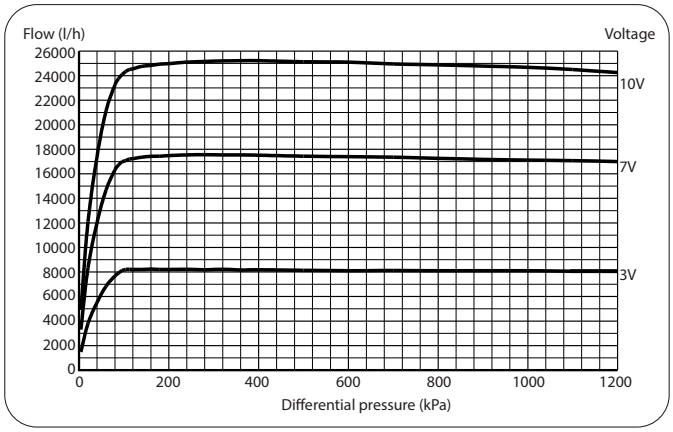
OPTIMA Compact EP valve design has a linear control characteristic. The control characteristic is independent of the flow setting and available pressure.

Because of the independent characteristic the actuator setting can be used to change the valve response from linear to logarithmic (Equal Percentage).



Flow rate vs. Differential Pressure

Voltage: 10V, 7V, 3V
(Liniar actuator characteristic)

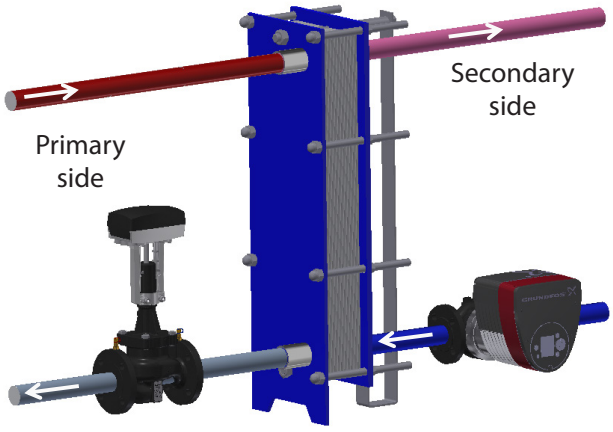


OPTIMA Compact EP

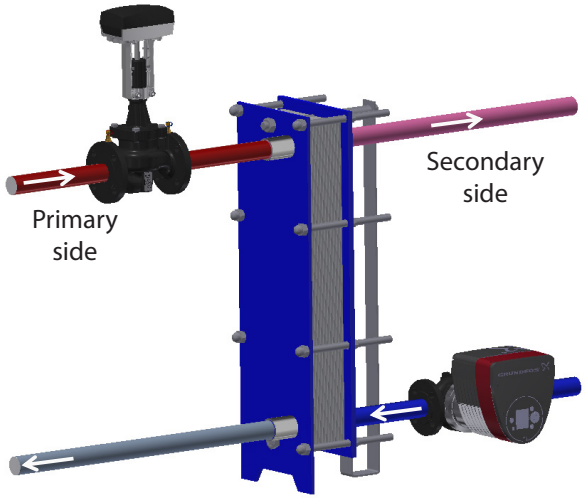
DN50-DN200

Application Diagrams

OPTIMA Compact EP can be installed in any heating and cooling system where full pressure independent modulating control is required. The valve can be installed both on the flow and return side of a plate heat exchanger, as long as the temperature and differential pressure specifications are taken into consideration.



OPTIMA Compact EP installed on the return side



OPTIMA Compact EP installed on the flow side

OPTIMA Compact EP sizing example

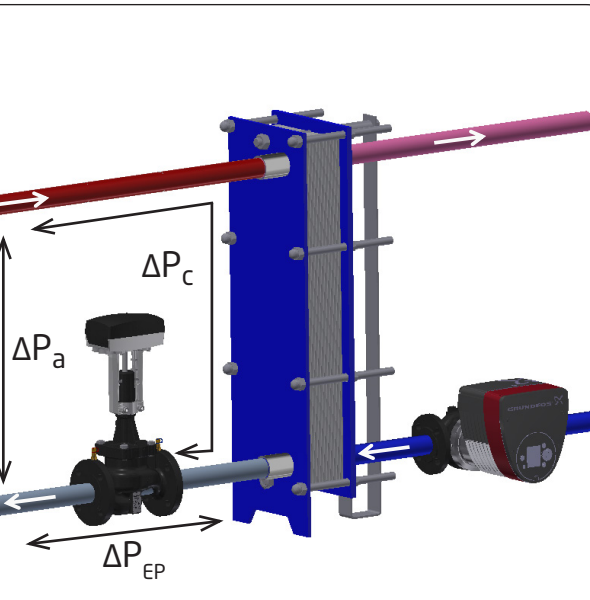
A district heating substation should be sized for a building's central heating system.

The substation uses a heat exchanger. The flow through the heat exchanger must be controlled by means of a motorized valve in order to achieve the required water temperature on the secondary system side.

OPTIMA Compact EP is chosen for the application.

The valve must be sized for the following conditions:

- The heat exchanger must provide 750 kW
- The supply water temperature on the primary system side is 130°C
- The return water temperature on the primary system side is 70°C
- The differential pressure available on the primary system side is ΔP_a = 900 kPa (9 bar)
- The pressure loss in all the pipes, heat exchanger and other components of the substation except for the control valve (OPTIMA Compact EP) is ΔP_c= 50 kP$_a$ (0.5 bar)



OPTIMA Compact EP

DN50-DN200

OPTIMA Compact EP sizing example (continued...)

The required flow through OPTIMA Compact EP is:

$$Q = \frac{E\ [kW]}{cp\ [kJ/(kg\ K)] * \rho\ [kg/dm^3] * \Delta T[K]}$$

cp – water heat capacity, kJ/(kg K)

ρ – water density, kg/dm^3

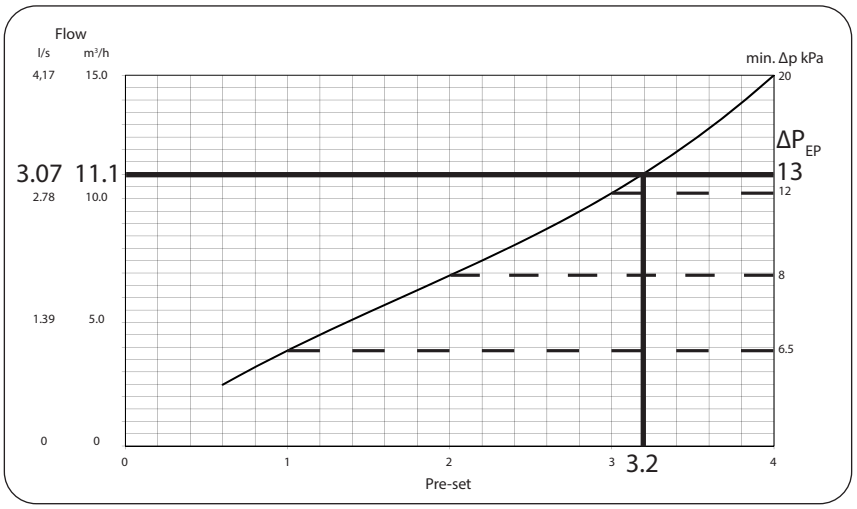
ΔT – supply and return water temperature difference, K

E – heat exchanger capacity, kW

$$Q = \frac{750\ kW}{4.20\ [kJ/(kg\ K)] * 0{,}970\ [kg/dm^3] * (130\text{-}70)K} = 3{,}07\ dm^3/s = 11{,}100\ l/h$$

The required OPTIMA Compact EP should be selected based on the graphs.

In this case the OPTIMA Compact EP DN50 LF meets the specification.



The selected OPTIMA Compact EP DN50 LF requires ΔP_{EP} = 13 kPa of differential pressure and should be set to position 3.2 to provide the sizing flow.

The total required pressure loss in the substation is:

$$\Delta Pc + \Delta P_{EP} = 50\ kPa + 13\ kPa = 63\ kPa$$

It is lower than the available differential pressure in the substation: ΔPa = 900 kPa.

The greatest differential pressure that OPTIMA Compact EP could be subjected to in the substation during sizing conditions is:

$$\Delta Pmax = \Delta Pa - \Delta Pc = 900kPa - 50kPa = 850\ kPa$$

Since OPTIMA Compact EP can operate at a differential pressure of 1200 kPa (12 bar) and the greatest differential pressure in the district heating system is 900 kPa, the valve can be used in the substation.

No additional differential pressure control valve is required in the substation as the integrated in OPTIMA Compact EP differential pressure controller will compensate for any pressure fluctuations in the district heating system.

OPTIMA Compact EP

Text for technical specifications

The length of the modulating stroke shall be independent of flow setting. The valve shall have full stroke modulating control at all flow settings and the stroke should not be restricted by the flow setting position.

The modulation and flow setting shall be one combined unit with a linear modulating motion and a rotational flow setting motion.

The valve characterization shall not be changed at different flow settings.

The combined flow setting and modulating control unit shall be pressure independent.

The pressure independent control valve shall contain a combined flow setting, differential pressure control and modulating bonnet assembly.

The valve housing shall be GJL-250/GJS-400.

The valve shall have a spring made of stainless steel, a Diaphragm made of Reinforced EPDM and O-rings made of EPDM.

The valve shall have flange connections according to EN 1092.

The valve shall have a maximum operating differential pressure of 1200 kPa (12 Bar), and a temperature range, from -10°C to +150°C.

The valve shall have an external adjustable analogue step less presetting scale from minimum to maximum flow.

The valve shall be capable of closing against a maximum differential pressure of 1200 kPa (12 bar) with a leakage rate at maximum 0.01 % of max rated volumetric flow and comply to EN1349 Class IV.

Pressure independent control valves must be tested in accordance with the BSRIA document BTS.1 'Test Method for Pressure Independent Control Valves' and manufacturers must be able to provide the test results upon request.
