

# OPTIMA Compact

DN10-DN50

## Application

OPTIMA Compact pressure independent balancing & control valve (PIBCV) is used in heating and cooling systems in applications with Fan Coil Units, Chilled Beams or other terminal unit applications.

OPTIMA Compact provides modulating control with full authority regardless of any fluctuations in the differential pressure of the system.

OPTIMA Compact combines an externally adjustable automatic balancing valve, a differential pressure control valve and a full authority modulating control valve.

OPTIMA Compact makes it simple to achieve 100% control of the water flow in the building, while creating high comfort and energy savings at the same time.

An additional benefit is that no balancing is required if further stages are added to the system, or if the dimensioned capacity is changed.

Energy saving due to optimal control, lower flow and pump pressure. Maximized  $\Delta T$  due to faster response and increased system stability.

## Benefits

### Design

- Less time to define the necessary equipment for a hydronic balanced system (only flow data required)
- No need to calculate valve authority. Always one
- Flexibility if the system is modified after the initial installation

### Installation

- No further regulating valves required in the distribution pipework when OPTIMA Compact is installed at terminals.
- Total number of valves minimized due to the 3-in-1 design
- Minimized commissioning time due to automatic balancing of the system
- No minimum straight pipe lengths required before or after the valve

### Operation

- High comfort for the end-users due to high precision temperature control
- Longer life due to less movements of the actuator

## Features

- The presetting function has no impact on the stroke; Full stroke modulation at all times, regardless the preset flow
- The constant differential pressure across the modulating control component guarantees 100% authority
- Automatic balancing eliminates overflows, regardless of fluctuating pressure conditions in the system
- Compatible with thermic actuators On/Off or 0-10V, normally closed. Also compatible with motoric actuators 0-10V, (Linear or Logarithmic) or 3 point control
- Differential pressure operating range up to 800 kPa
- High flows with minimal required differential pressure due to advanced design of the valve
- Small dimensions due to compact housing
- Higher presetting precision due to stepless analogue scale
- Rangeability > 100:1

# OPTIMA Compact

DN10-DN50

## Design

The design of OPTIMA Compact combines high performance with small size and compact construction.

The main components of the valve are:

- ① Differential pressure control
- ② Modulating control component
- ③ Presetting scale (not accessible when the actuator is mounted)
  - a) Flow range: Low-High
  - b) Stroke: 2.5 - 5.0 - 5.5mm
- ④ P/T Plugs
- ⑤ Actuator

## Function

OPTIMA Compact can be flushed and commissioned before the actuator is installed.

The presetting of the dial is user-friendly requiring only a simple flow vs. presetting table. Once the flow is set, the actuator can be mounted and the valve ready to operate.

For lowest energy consumption, check the differential pressure at the index valve to set the pump at minimum speed.

## Operating Pressure

The OPTIMA Compact (DN10 to DN50) can operate to a maximum differential pressure of 800 kPa (8 bar)

## Close Off Pressure

OPTIMA Compact is capable of closing against the following differential pressures to EN 1349 Class IV:

- DN10 to DN25: 600 kPa (6 bar) - based on 100N actuator force
- DN10 to DN25: 800 kPa (8 bar) - based on 160N actuator force
- DN25L to DN32: 800 kPa (8 bar) - based on 100N actuator force
- DN40 to DN50: 800 kPa (8 bar) - based on 400N actuator force

## Isolation

When fitted with the isolation cap (DN10 to DN32 only), the OPTIMA Compact is capable of isolation to 10 bar.

# OPTIMA Compact

DN10-DN50

## Operation principle

The innovative design of OPTIMA Compact features a modulating control component that retains 100% authority at all times.

With the OPTIMA Compact there are two independent movements for the presetting and the modulating function. During presetting, the inlet area moves radially without interfering with the length of the stroke. During modulating, the inlet area moves axial taking advantage of the full stroke.

Whilst the control component provides proportional modulation irrespective of the preset flow, the automatic balancing guarantees that the flow will never exceed the maximum preset flow.

Regardless of pressure fluctuations in the system, the maximum flow is kept constant up to a maximum differential pressure of 800 kPa.

## Flow rate vs. Differential Pressure

**Preset flow: 300 l/h, 150 l/h**

## Flow rate vs. Voltage

**Preset flow: 200 l/h**

## Flow rate vs. Differential Pressure

**Voltage: 10V, 7V, 3V**

## Text for technical specifications

The length of the modulating stroke shall be independent of flow setting. The valve shall have full stroke modulating control at all flow settings and the stroke should not be restricted by the flow setting position.

The modulation and flow setting shall be one combined unit with a linear modulating motion and a rotational flow setting motion.

The valve characterization shall not be changed at different flow settings.

The combined flow setting and modulating control unit shall be pressure independent.

The Pressure Independent Control Valve shall contain a combined flow setting, differential pressure control and modulating bonnet assembly.

The valve housing shall be hot stamped DZR brass DN10-32 and ductile iron DN40-50.

The valve shall have a spring made of stainless steel, a diaphragm made of HNBR and O-rings made of EPDM.

The valve housing shall be PN25 rated and suitable for 120°C.

The valve shall have a thread according to ISO 228.

The valve shall have a maximum operating differential pressure of 800 kPa (8 Bar).

The valve shall have an externally adjustable, analogue step-less presetting scale from minimum to maximum flow.

P/T plugs shall be available as an option.

The valve shall be capable of closing against a maximum differential pressure of 800 kPa (8 bar) with a leakage rate at maximum 0.01% of max rated volumetric flow and comply to EN1349 Class IV.

Pressure independent control valves must be tested in accordance with the BSRIA document BTS.1 'Test Method for Pressure Independent Control Valves' and manufacturers must be able to provide the test results upon request.
